#### AI ASSISTED CODING

NAME:B.SRISHANTH ROLL NO:2403A510G3 ASSIGNMENT:4.1

# **Task #1 – Zero-Shot Prompting with Conditional Validation**Objective

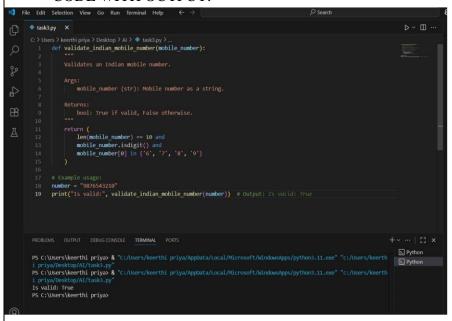

Use zero-shot prompting to instruct an AI tool to generate a function that validates an Indian mobile number.

#### Requirements

- The function must ensure the mobile number:
  - o Starts with 6, 7, 8, or 9
  - Contains exactly 10 digits

## **Expected Output**

- A valid Python function that performs all required validations without using any input-output examples in the prompt.
- CODE WITH OUTPUT:

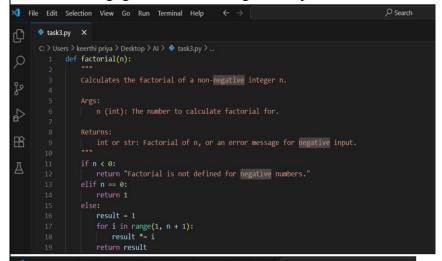

# Task #2 – One-Shot Prompting with Edge Case Handling Objective

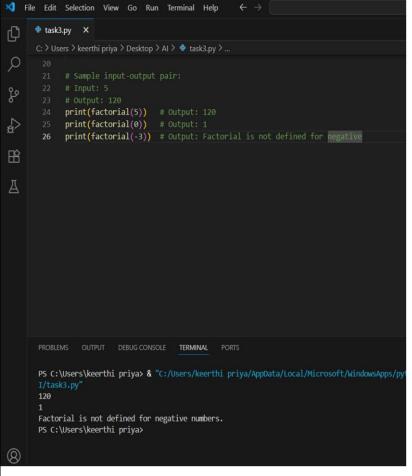

Use one-shot prompting to generate a Python function that calculates the factorial of a number.

#### Requirements

- Provide one sample input-output pair in the prompt to guide the AI.
- The function should handle:
  - 0! correctly

- Negative input by returning an appropriate message Expected Output
  - A Python function with correct factorial logic and edge case handling, generated from single example.

Task #3 – Few-Shot Prompting for Nested Dictionary Extraction

#### Objective

Use few-shot prompting (2–3 examples) to instruct the AI to create a function that parses a nested dictionary representing student information.

#### Requirements

- The function should extract and return:
  - Full Name
  - o Branch
  - SGPA

#### **Expected Output**

• A reusable Python function that correctly navigates and extracts values from nested dictionaries based on the provided examples.

Task #4 – Comparing Prompting Styles for File Analysis

### Objective

Experiment with zero-shot, one-shot, and few-shot prompting to generate functions for CSV file analysis.

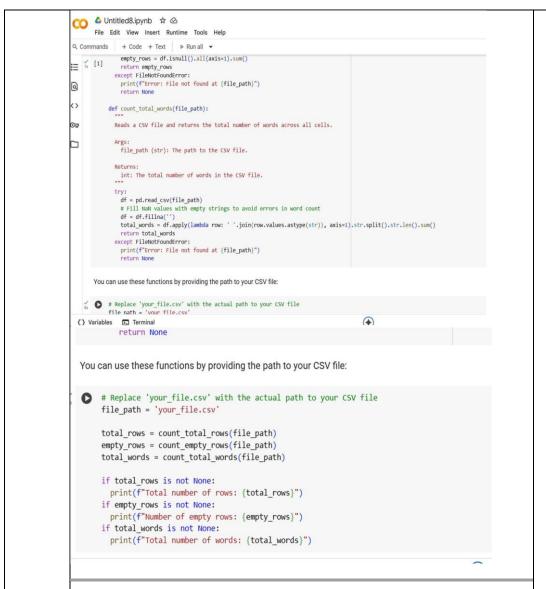

### Requirements

- Each generated function should:
  - o Read a .csv file
  - o Return the total number of rows
  - o Count the number of empty rows
  - o Count the number of words across the file

#### **Expected Output**

• Working Python functions for each prompting style, with a brief reflection comparing their accuracy, clarity, and efficiency.

<u>a</u>
       import pandas as pd
<>
            def count_total_rows(file_path):
OT.
             Reads a CSV file and returns the total number of rows.
file_path (str): The path to the CSV file.
             int: The total number of rows in the CSV file.
              df = pd.read_csv(file_path)
               return len(df)
             except FileNotFoundError:
               print(f"Error: File not found at {file_path}")
               return None
            def count_empty_rows(file_path):
             Reads a CSV file and returns the number of empty rows.
               file_path (str): The path to the CSV file.
```

# Task #5 – Few-Shot Prompting for Text Processing and Word Frequency

Objective

Use few-shot prompting (with at least 3 examples) to generate a Python function that processes text and analyzes word frequency. Requirements

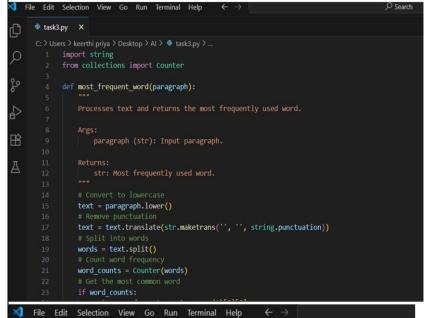

The function must:

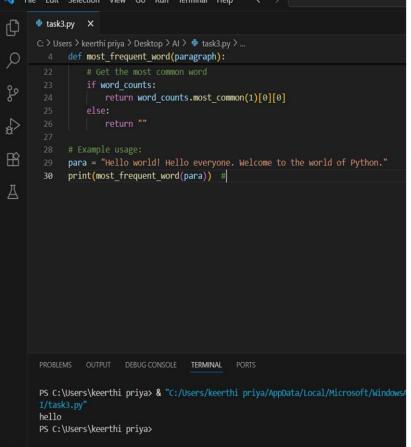

- Accept a paragraph as input
- Convert all text to lowercase
- Remove punctuation
- Return the most frequently used word

### **Expected Output**

• A functional Python script that performs text cleaning,

tokenization, and returns the most common word using only the examples provided in the prompt

**Note:** Report should be submitted a word document for all tasks in a single document with prompts, comments & code explanation, and

output	and	if red	mired.	screenshots
Output	unu	11 100	un cu,	Beleensiiots

# **Evaluation Criteria:**

Criteria	Max Marks
Zero Shot (Task #1)	0.5
One Shot (Task#2)	0.5
Few Shot (Task#3, Task#4 & Task #5)	1.5
Total	2.5 Marks
